

SecurityIQ for Microsoft SharePoint®

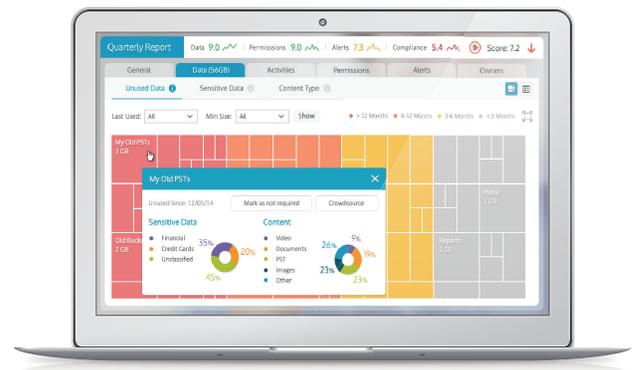

BENEFITS:

- Identify where sensitive data resides to focus the efforts on the data you value most
- Identify who has effective access to what data, and who is actually using it
- Reduce risk by addressing overexposed data and excess access requests
- Minimize response time to breaches and minimize damage
- Manage the access lifecycle for unstructured data across the organization
- Engage business users to protect the data they own
- Cut costs by eliminating stale data and accounts and automating audit requirements

The world is more interconnected than ever before. In order to support this new paradigm of how organizations work – in multiple countries, offices and even coffee shops – collaboration tools have exploded in popularity and in importance. SharePoint®, as a data management portal, enables employees and contractors to have access to their data when and where they need it. But from a risk perspective, the vast amount of unstructured data maintained in SharePoint® makes it a high priority target for any malicious activity. A successful data breach is very likely to result in sensitive data exposure, heavy direct financial loss, serious reputation damage and increased audit requirements.

How SecurityIQ Can Help

To effectively protect the unstructured data within SharePoint®, organizations need technology to provide them with full visibility into sensitive data stored within it, including who can access it and who is accessing it. A solution must have a complete understanding of SharePoint's data access model, while not affecting the performance of the protected SharePoint® environment.

SecurityIQ dramatically reduces security risk and increases compliance by:

- Identifying where sensitive data resides, who has effective access to it, how they are using it and putting effective controls in place to secure it
- Providing proof of compliance during audits and reducing time spent on forensics
- Electing the rightful data owners and enabling them to protect their own data
- Extending the IAM strategy to provide comprehensive access governance to unstructured data

SecurityIQ also easily demonstrates ROI by identifying stale data and accounts, automating the organizational audit requirements, and streamlining access reviews and requests to reduce the IT workload.

SecurityIQ Key Features and Benefits

Data Classification

Data classification assists in locating your valuable, highly confidential information (HCI). SecurityIQ can search for common or proprietary data types in files based on their content (keywords, wildcards, regular expressions, and metadata) or on how the files are being used by an organization's employees. SecurityIQ is delivered with built-in verification algorithms (e.g. 'Luhn' for PCI data, etc.) to eliminate false-positives.

Context-Aware Activity Monitoring with Real-Time Alerting

As time is of the essence when it comes to data security, activity monitoring in SecurityIQ is done in real-time. Every monitored activity is enriched with its full security context from in place security systems (Active Directory, IAM or any other data source). The full context is crucial to identify violations and respond to them in real-time, and it is also available when performing forensics and when creating activity policies.

Permissions Collection and Analytics

SecurityIQ automatically collects and analyzes all granted entitlements on your SharePoint® environments, while considering SharePoint® groups and custom permissions. Aside from answering who has access to what data, the process also reveals overexposed data, other implemented access management violations and bad practices.

Business Users Involvement and Data Ownership

Business users are the true owners of an organization's data. Electing the rightful data owners requires a deep understanding of the business – one that lies only in the minds of the employees. SecurityIQ is the only product on the market to utilize crowdsourcing techniques to elect the rightful data owners. The elected owners are provided with a set of dedicated dashboards to enable them with actionable intelligence about the data they own.

Access Lifecycle Management

Access lifecycle management is the key to ensuring access is granted on a "need-to-know" basis. SecurityIQ streamlines access requests and manages periodic and risk-based access reviews for unstructured data. The system can also automate provisioning and revocation of access (access fulfillment) to reduce costs, IT workload and to avoid potential human errors.

About SailPoint

As the fastest-growing, independent identity and access management (IAM) provider, SailPoint helps hundreds of global organizations securely and effectively deliver and manage user access from any device to data and applications residing in the datacenter, on mobile devices and in the cloud. The company's innovative product portfolio offers customers an integrated set of core services including identity governance, provisioning and access management delivered on-premises or from the cloud (IAM-as-a-service).
