# WatchDox Solutions
Make the most out of your deployment of WatchDox

WatchDox allows enterprises to realize numerous business workflows with increased productivity and cost savings. The unique WatchDox document-centric security approach allows controls and tracking to be built into documents. As such, employees can safely access, share and collaborate on sensitive information on any device with any user, reaping the benefits while reducing the risk associated with sharing across organizations.

Secure File Sharing and Sync

WatchDox is the only file sharing and sync solution that makes files smarter, building security and usability into the files themselves. As an enterprise-grade replacement to Dropbox, WatchDox synchronizes documents across all devices and ensures the most updated documents are always available to all collaborators.

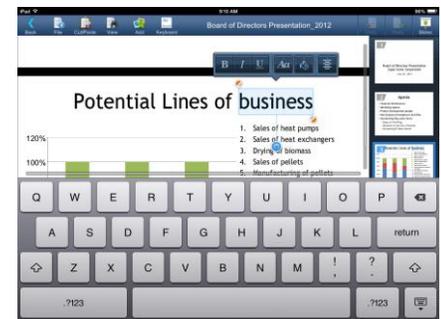

Mobile Productivity and Collaboration

WatchDox can help enterprises realize the benefits of mobile productivity and collaboration with a secure, integrated suite of annotating and editing tools. When it comes to manipulating content, once a file leaves the system IT loses control and trackability. Thus, WatchDox believes it is critical to build in relevant content features to maintain consistent policies. WatchDox is the only solution on the market that provides fully integrated collaboration tools.

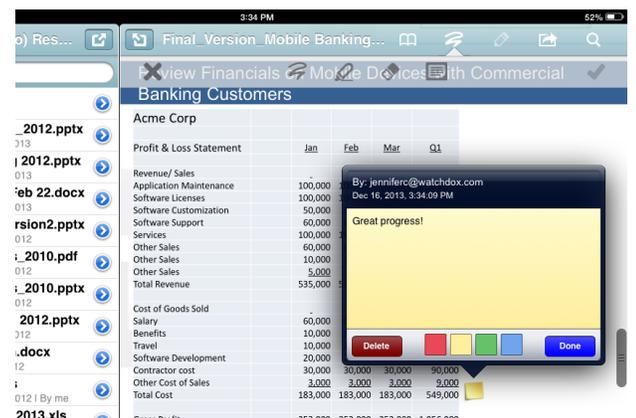

WatchDox Apps

WatchDox Editor

Choose between WatchDox Apps and WatchDox Editor to appropriately address your business needs. WatchDox Apps provides full Microsoft Office functionality and real-time, streaming collaboration. Seamlessly edit complex Excel functions and configure PowerPoint transitions with multiple collaborators viewing the changes as they happen. WatchDox Editor provides a simplified user interface for in-line editing and basic formatting, suitable for quick changes both online or offline.
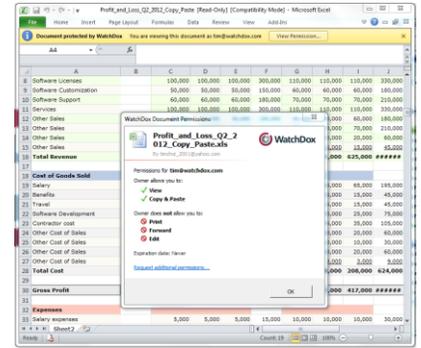

Mobile Content Management

The massive trend towards BYOD and the consumerization of IT are top of mind for enterprise IT executives: Employees and business partners want access to corporate documents on mobile devices. Corporate content already exists in a myriad of places, including file servers and SharePoint. Only WatchDox can provide the proxy architecture required to reconcile all requirements, both what users need to get the job done and what enterprise IT needs to retain visibility and control of corporate information on any kind of device whether employee, business partner, personal or work-issued.
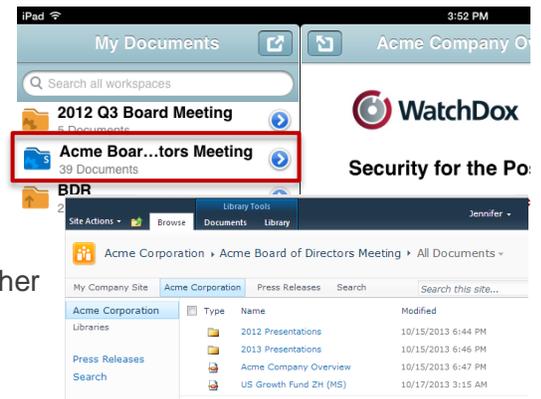

Intellectual Property Protection

WatchDox makes it simple to manage business-critical intellectual property. Powerful policies can be applied through a central administrative console to provide document controls such as access expiration, functional restrictions (prevent unauthorized print, download, copy, edit) and administrative watermarks, to guarantee that regardless of where files go the enterprise retains full control. Therefore, if an employee leaves to join a competitor or a business partnership ends, a company administrator can immediately revoke access to all shared, sent or synced documents, even if they had already been downloaded.

Mobile and External SharePoint

With WatchDox, new usage models can be realized with existing SharePoint investments. WatchDox can extend SharePoint libraries to be accessed on mobile devices or shared externally to business partners. With security built into the documents, enterprises can now safely allow a CFO to access financial documents from SharePoint on her iPad to share with an external auditor.

Digital Board Room

WatchDox makes it simple for corporate administrative assistants to build, distribute and update board packages and executive briefings in a paperless way. Board members can conveniently access sensitive board materials on their own devices – in the office or on the road. WatchDox guarantees full control of documents at all times, enables committee collaboration and unlocks user productivity through sharing documents and annotations. Start from the top and equip your leaders to guide the company in transforming how people communicate and work.

Customized Enterprise Portal

Most enterprises have already implemented a variety of means to get files to their users, often including custom-built web portals or extranets. Many of these systems pre-date the rise of enterprise mobility and cannot systematically secure, update and sync the content they deliver. Let WatchDox help leverage your corporate brand and existing investments by providing the platform to make existing web portals mobile-friendly. Only WatchDox can deliver everything that enterprises require, from the strictest controls for their most sensitive corporate data along with providing a highly usable, consumer-like experience for portal users.

Next Generation Virtual Data Room

WatchDox provides the next generation of data rooms, built to marry security and mobility for savvy users who demand ease-of-use. WatchDox guarantees full control over shared, deal-related documents – ensuring that only authorized parties have custom access, providing the ability to revoke access and delivering a full audit trail of all reportable document activities. This unique security model provides peace of mind for companies to share sensitive information and enable valuable business transactions.
